1. Project Goal

To develop a secure ServiceNow system that restricts access to records based on user roles and field values.

2. Main Activities

- Create the Institution Details table and required fields.
- Create users and roles.
- Configure Read, Write, Create and Delete ACLs.
- Apply the Branch-based access condition.
- Add the required script for access control.
- Test authorized and unauthorized access.

3. Resources Required

- ServiceNow Developer Instance
- Internet connection
- Administrator/security_admin access
- User and role configuration
- ACL configuration and scripting

4. Expected Result

The system should allow authorized users to perform permitted operations while restricting unauthorized access to records.

5. Project Outcome

A secure and role-based record access system is developed in ServiceNow.

6. Conclusion

The proposed Access Control system provides a secure and structured way to manage user access. By checking the user role, ACL permissions, and branch conditions/scripts, the system can determine whether access should be allowed or denied. This helps prevent unauthorized access and ensures that users can access only the resources permitted to them.
